

LINEAR SLOT ELECTRONIC VAV CEILING DIFFUSERS

DESCRIPTION

Rickard linear slot diffusers provide an effective means of distributing conditioned air into the perimeter zones of a building where the temperature control requirements are the most demanding. The slim, attractive shape of the diffuser ensures that its subtle design works with most architectural styles. At the same time its superior aerodynamic design ensures that the air distribution creates no drafts, is quiet and highly efficient.

A linear slot diffuser must be connected to a wall thermostat (temperature sensor) for it to perform as a master diffuser. The diffuser can then operate with one or more slave diffusers, or as a standalone system.

Air volume control is achieved with the opening and closing of vanes driven by an electric actuator. This increases or decreases the aperture size which varies the volume of conditioned air to enter the occupied space.

Features

- Air flow direction from diffuser can be easily adjusted by the occupant.
- Available in one or two slots and widths ranging from 660 to 1560mm.
- Air discharge volumes from 10% to 100% can be achieved.

DIMENSIONS

RICKARD ELECTRONIC VAV DIFFUSER SERIES

AIR FLOW DIRECTION

Two way air flow

One way air flow - downward

One way air flow - left

One way air flow - right

SPECIFICATIONS AND PERFORMANCE

Neck Size (mm)	Width Size (mm)	Product Numbers			Neck Pressure (Pa)					Neck Pressure (Pa)					Neck Pressure (Pa)				
		Single Slot (80mm, high)	Dual Slot (120mm, high)		30	40	50	60	70	30	40	50	60	70	30	40	50	60	70

Performance data applicable for Dual Slot Linear Diffusers only

Throw data is taken 25mm below the ceiling on a line through the centre of the diffuser with the vanes fully open & an air velocity of 0.25m/s.

Noise criteria levels apply to a single diffuser mounted in a room having a Sound Absorption of 10dB in octave bands having centre frequencies from 125Hz to 8000Hz (ie. the difference between Sound Pressure Level (dB re: 10⁻⁶ Pa) and Sound Pressure Level (dB re: 10⁻¹² Pa) is equal to 10dB). These levels represent only the noise generated by the diffuser and do not take into account any duct-borne noise.

Diffusers are factory set for a minimum of 30% of the maximum flow levels reflected above. It should be noted that minimum air flow settings are approximate & may require to be reset on site to compensate for actual site system pressures.
