

## INTRODUCTION

### PRODUCT RANGE

The wide range of products includes:-

- backward-inclined centrifugal fans
- mill exhaust centrifugal fans
- high pressure blowers and vacuum producers
- turbovane radial blade fan
- special purpose-designed fans when the application demands.

### FANS BY FANTECH - PRODUCT SELECTION PROGRAM

The data in this section of the catalogue permits users to make quick selections and to determine the space required by the fans, but it is primarily intended to be a supplement to the Fans by Fantech Product Selection Program.

The Product Selection Program is specific to the backward-inclined single and double-width centrifugal fans used in the air conditioning, ventilation and dust control industries. It enables users to select the fan and get a print-out of the performance curve and dimensions of the selected fan in the required handing. The Product Selection Program is limited to showing handings ACW0, ACW90 and ACW180, but others can be provided. A copy of the program on USB is available on request or can be downloaded via the Fantech website [www.fantech.com.au/psp/](http://www.fantech.com.au/psp/)

### PERFORMANCE

The data given here, and in the Fans by Fantech Product Selection Program, is based upon tests conducted in accordance with BS848:Part 1, 1980 for air flow and to AS1217-Section 3.4, 1972 for noise.

### CONSTRUCTION

#### Backward-inclined Centrifugal Fans

Both the Laminar (L) and Aerofoil (AL) rotors use the same fan casing.

The 'L' blade is a backward-inclined blade.

The 'AL' blade has a backward-inclined hollow die-formed aerofoil section.

Both designs have a non-overloading power curve.

Apart from the blades, the rotors are similar in construction, using the same backplate, hub and inlet spinning.

Rotors are balanced, both statically and dynamically, in an electrodynamic balancing machine to the balance quality grade G6.3.

Fan shafts are machined from Grade CS1030 bright steel conforming to AS1443-1983 and are designed such that the first critical speed of the shaft is equal to, or greater than, 130% of the operating speed.

Re-greasable, single-row, deep-grooved ball bearings in pillow block housings are fitted as standard, or, where the duty warrants, grease-lubricated, double-row ball or roller bearings in grease-relieved split plumber block housings.

The casings are fabricated from fully-welded, hot-rolled steel sheet plate conforming to AS1594-1992.

### INSTALLATION

The amount of space required around the fans must be considered to avoid uneven air flow and pulsations to ensure the fan will be able to work to its full potential. Generally this necessitates leaving a space equivalent to one impeller diameter between the fan inlet and a wall or baffle. In a situation where two or more fans are mounted in parallel, then a space equivalent to two fan diameters must be left between fan inlets that face each other. If that amount of space cannot be provided a baffle must be erected between the fans, and the possibility that the fans may not operate to their full potential must be considered.

## HANDINGS

The full range of handings for both single and double-width units are available (see page E-12).

## SPECIAL APPLICATIONS

The fans can be designed to handle air at elevated temperatures continuously. The treatment to the fans in these situations will differ according to whether it is a single or double-width fan but both can be adapted to suit the application; double-width fans are generally limited to 120°C when fitted with a class H motor and built to arrangement no. 3.

## ANCILLARY EQUIPMENT

The fans can be provided with the following:-

- access panel
- inlet screens
- drilled discharge angle flanges (spigot connection is standard)
- matching angles
- vibration isolators
- drain connection
- casings can also be split to fit through specific openings
- variable inlet vane control
- heat slinger and guard
- spark-resistant construction
- stainless steel or aluminium (standard construction is mild steel)
- non-standard finishes (prime coat of grey, zinc phosphate is standard)
- inverter speed controllers
- attenuators

## OTHER PRODUCTS

General information on the Mill Exhaust, High Pressure Blowers and Vacuum Producers is given on page E-16; refer to sales engineers for more specific selection and dimensional information.

## DESCRIPTION

The Centrifugal Fan range of backward-inclined laminar or aerofoil-section fans, encompasses both single-width and double-width units.

They feature high strength fully welded mild steel casings and each range is available in 20 sizes, extending from 305mm (12 inch) to 2035mm (80 inch) diameter.

## Typical Applications

Designed for a wide range of supply or exhaust applications such as office buildings, shopping centres, hospitals and universities. The fans are capable of handling clean air to installations involving hot, toxic, noxious or explosive gases.

## Features

- Casings are made of high strength fully welded mild steel.
- Finished in a durable prime coat of grey coloured zinc phosphate. Other finishes available.
- Choice of high performance backward-inclined laminar or aerofoil-section blades available.
- Impellers are a high strength welded construction.
- Wide range of performances available. See **Special Note**.
- Multi-speed motors can be supplied.
- Belt or direct-drive arrangements available.
- Speed-controllable using variable speed drives.
- Can be ordered to handle hot, toxic, noxious or explosive gases.

## Construction

Fully welded mild steel casings.

Prime coat of grey, zinc phosphate is the standard finish.

Impellers are fully welded and are available as backward-inclined laminar(L) or aerofoil-section(AL) design.

## Motors

Type - squirrel cage induction motors

Electricity supply - single or three-phase to suit a wide range of voltages and frequencies.

Bearings - ball or roller.

Motors with multi-speed windings or to suit Ex d, Ex e, Ex nA, Ex tD. or similar special needs can be fitted.

## Internal Thermal Protection

Thermistors can be provided.

## Testing

Air flow tests to BS848:Part 1 1980

Noise tests to AS1217-1972

## Wiring Diagram

See page N-6, diagrams DD 1, 2, 3.

## Special note

The quick-selection graphs on page E-11 are designed to give a close indication of the fan size required to perform the specified duty. Detailed selections can be determined using the Fans by Fantech Product Selection Program, or by referring to our sales engineers.

## ANCILLARY EQUIPMENT

Refer to the ancillary equipment list on pages I-1 and M-1.

## SUGGESTED SPECIFICATION

The Centrifugal Fans shall be of the SWSI or DWDI type as supplied by Fantech Pty Ltd.

The housings shall be of welded mild steel with a grey, zinc phosphate finish.

Impellers shall suit single-width or double-width arrangements as required and be backward-inclined laminar or aerofoil-section. Impellers shall be fully welded.

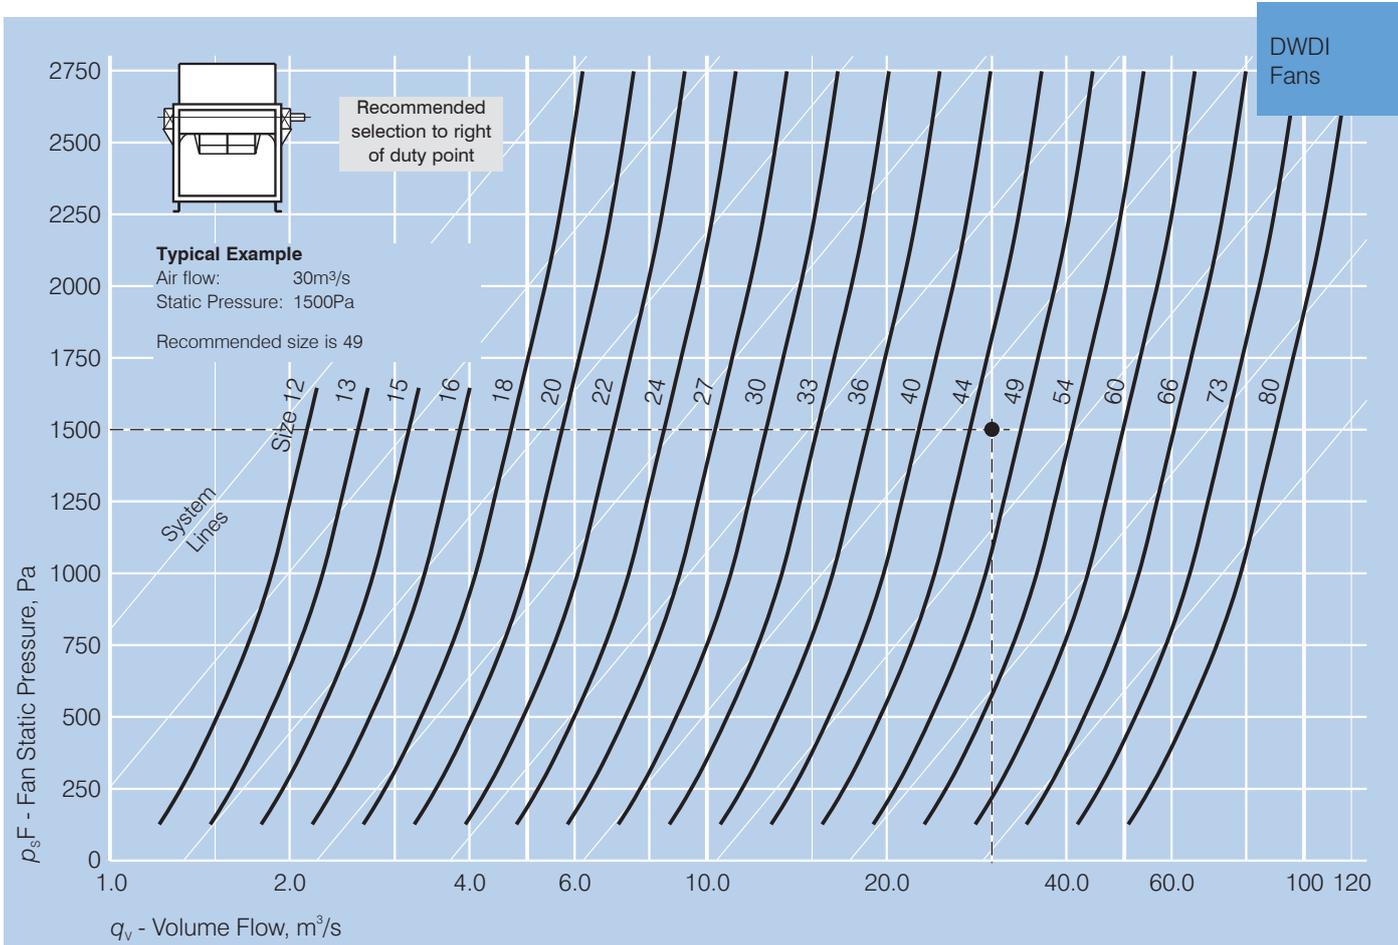

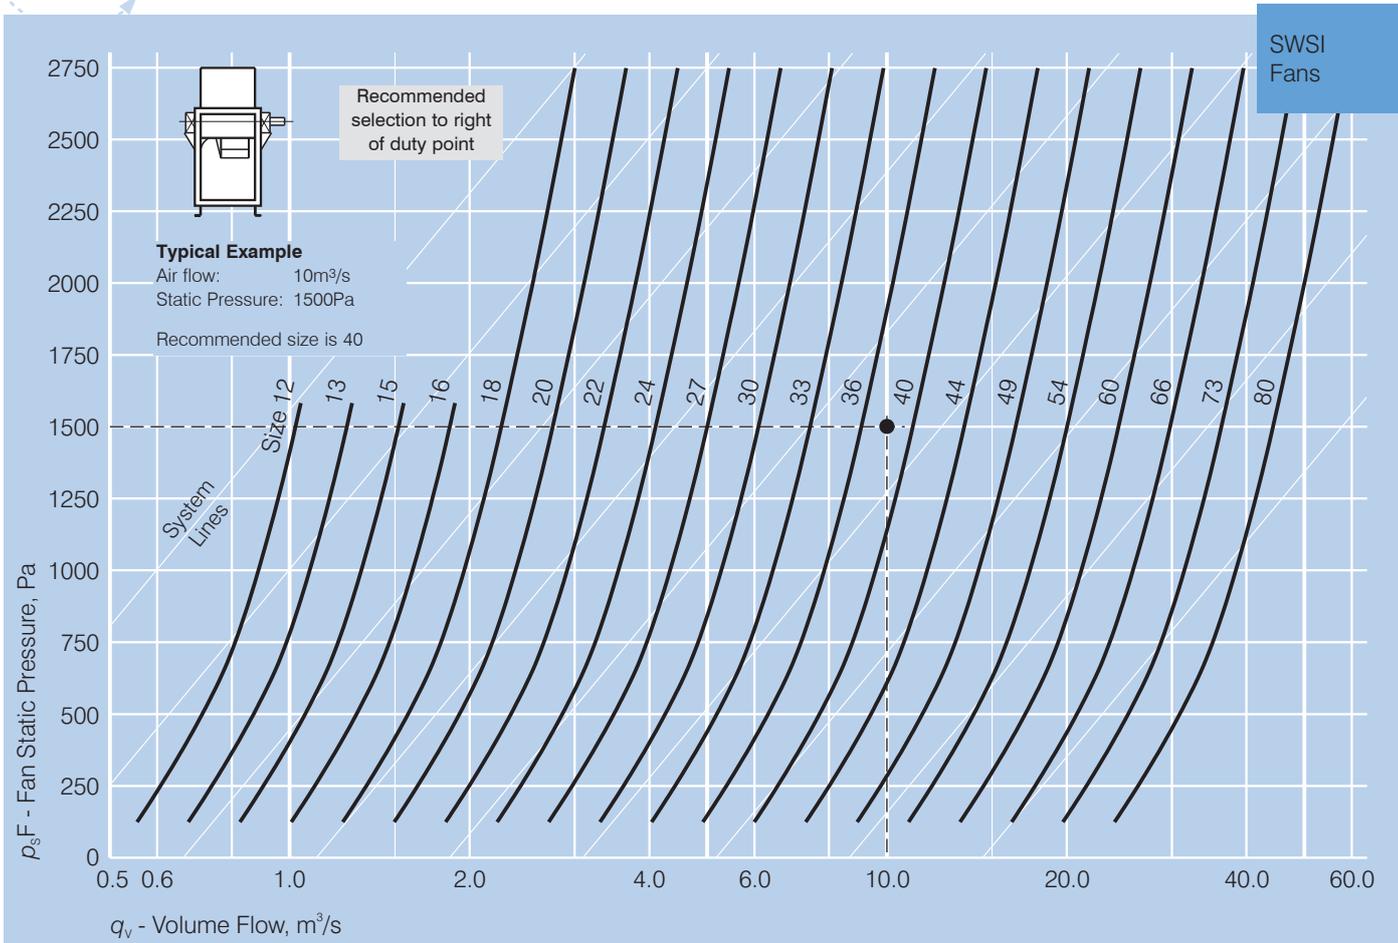

All fans shall be tested to BS848:Part 1 1980 for air flow and AS1217-1972 for noise.

## HOW TO ORDER

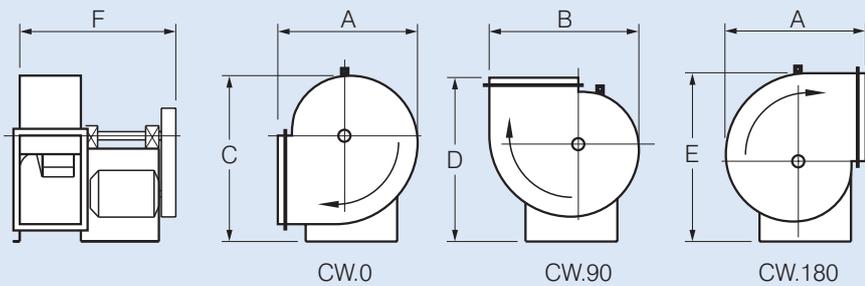

The following information is required before production can commence:

- Performance required
- Air temperature, if other than standard
- Fan size and type; e.g. SWSI or DWDI
- Impeller type; e.g. backward-inclined laminar (L) or aerofoil-section (AL)
- Fan handing
- Discharge angle
- Position of the drive motor
- Degree of vibration isolation required
- Electricity supply
- Motor type; e.g. standard motor or a motor to suit Ex d, Ex e, Ex nA, Ex tD, or other special specification
- Ancillary equipment. Refer to pages I-1 and M-1
- Finish, if other than standard
- Any special identification markings

\* Add the motor weight to get the approx. total weight. Motor weights are shown on page O-11. Dimensions shown are a guide only, certified drawings are available on request

## Direction of Rotation & Discharge Position

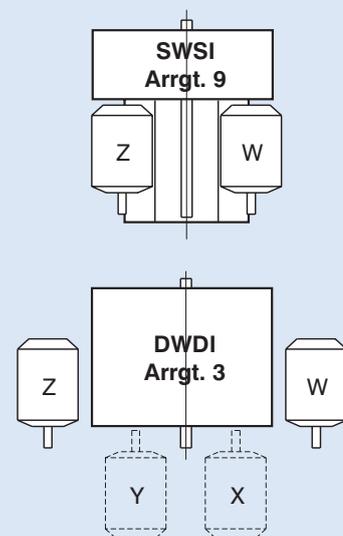

Direction of rotation is determined from drive side for both SWSI & DWDI fans

## Drive Arrangements - SW & DW Fans

Handling and dimension data on these tables are based on Arrangement 9 for SWSI and Arrangement 3 for DWDI.

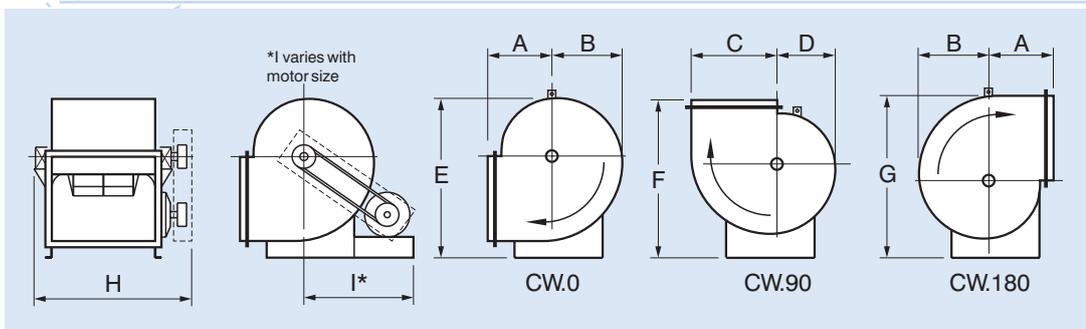

## Optional Motor Positions, Belt Drive

Motor positions Z & W are standard  
Additional price for positions Y & X

The designated motor positions never change, regardless of the direction of rotation.

# BLOCK DIMENSIONS & WEIGHTS - DWDI FANS

The handing illustrated is anti-clockwise, discharge angle 0° (ACW0). Other positions shown on the fan handing page can be determined by rotating the case about the shaft centre.

The drive motor (not shown) would be mounted on the bearing pedestal for Arrangement 9. For Arrangement 1, motor would be mounted on a channel frame attached to the fan base. See fan handing page for motor positions available.

Certified drawings are available on request.

For any arrangements not shown, refer to Fantech.

The handing illustrated is anti-clockwise, discharge angle 0° (ACW0). Other positions shown on the fan handing page can be determined by rotating the case about the shaft centre.

The drive motor (not shown) would be mounted on a channel frame attached to the fan base. See fan handing page for motor positions available.

Certified drawings are available on request.

For any arrangements not shown, refer to Fantech.
